split iPSCs into a full 6-well plate on the Friday before differentiation  
differentiate 5 of 6-wells with 10mL T2 in cell-repellent plates  
keep some iPSCs

Dissociation (process dishA and dishB separately)

1. Collect EBs into 50mL tubes (each plate). Wash the plate with 5mL PBS and added them into the tubes. Let EBs settle with gravity.
2. Remove sup. and add 4mL 0.25% trypsin (prepare 8mL 0.25% trypsin with 200U DNaseI)
3. Pipette ~8-10 with P1000 and then incubate the tubes in 37C.
4. pipette\*10 at 5min, 10min, 15min, and 20min
5. add 8mL FBS into 50mL tube -> pipette with 5mL pipet ~ 10 times
6. add 8mL CTWM -> pipette ~ 10 times
7. filter cells through 40um cell strainer into new tubes.
8. centrifuge at 200xg, 4min

## Treat 24h time point of 6-well plate

at 14:00 (without pyruvate)

2026年4月2日 星期四

## Platell: 24h timepoint of ATP/ADP

## Check reporter expression of column 5 and 6.

11:30-12:00 check (if I don't have time -> move it to Friday)

vLH105

A5 has some bright aggregates (I think it's similar to A6), signal is okay with 30% 300ms. It was dim at the beginning and will be brighter with the laser. Cell condition looked ok.

A6 expression is good (with 100% laser) and have some bright aggregates in cytosol. With 30% 300ms, the signal is around 150, but it's acceptable. Also pHred will get brighter with the strong laser

B5 has a lot of bright aggregates. Signal was okay (150) with 30% 300ms.

B6 has a lot of bright aggregates. Signal didn't improve and cells looked unhealthy

vLH185

C5: signal was bad with 50% 200ms

C6: Signal was not good with 50% 200ms (at most 200). Cells have okay signal in general (with 100% laser), but most signal is in the similar in cytosol and nucleus. Many mCherry+ cells. Many cell death, but cell condition looked okay

D5: signal was bad with 50% 200ms. Cells look sick in brightfield.

## RNA

Treat 6-well with 1h and 24h media without pyruvate from 13:00 - 14:00

collect RNA at 14:00
